Successful Startup Using CLG's ISOCRACKING Technology at Samir Morocco

Samir successfully completed the startup of its new unit using Chevron Lummus Global's ISOCRACKING technology at its Mohammedia Refinery in Morocco. The 36,000 BPSD unit is a key part of the Modernization Program at the Mohammedia Refinery.

The startup of the unit was one of the most important events for Samir in 2010, as it boosted the profitability by allowing Samir to minimize the refinery fuel oil production and produce Euro 5 Diesel and Jet-A1 Kerosene.

The successful startup underlines Chevron Lummus Global's leading market position with ISOCRACKING technology targeted for maximum conversion for production of high-quality automotive fuels.
