

ISOTREATING, ISODEWAXING and ISOFINISHING Technologies
from Chevron Lummus Global selected by Gazpromneft NIS
for Novi Sad Refinery

Gazpromneft NIS (NIS) will use Chevron Lummus Global's (CLG's) ISOTREATING, ISODEWAXING and ISOFINISHING technologies to produce naphthenic oils and lube base oils in Novi Sad to boost its refinery margins and become a producer in this niche market.

After implementation of this strategic project, the Novi Sad Refinery will be able to produce 180 tons of high-quality base oils annually, a significant amount of which will be exported. CLG's technologies were selected by NIS after a thorough analysis showed it offered the best available technology for producing lubes from naphthenic and paraffinic oils.

The General Manager of NIS, Mr. Kirill Kravchenko said: "In the preparation of the project, serious work has been carried out - we have analyzed in details not only our resource and technology base, but also the perspectives of this course, both in the region and in Europe. It is important that in the new phase, our team will be joined by highly skilled experts from Chevron Lummus Global USA, which has a rich experience in this business segment. The new investment package in refining not only revitalizes the outdated production capacities, but also is a serious step towards even greater diversification, and therefore the stability and balance of NIS business operations"
