Media Release

CLG's Technology Award for Bahrain Petroleum Company (BAPCO)

Chevron Lummus Global (CLG) has been awarded contracts including the license of its LC-FINING and ISOCRACKING technologies and engineering design packages for new 65,000 BPSD Residue Hydrocracking and 56,000 BPSD VGO Hydrocracking Units for the BAPCO Modernization Program (BMP). The BMP will expand the BAPCO refinery capacity and introduce further depth of conversion and upgrading of heavy oil. The CLG technologies upgrade low value residual oils to high value, high quality middle distillate products that meet the most stringent global specifications.

This is an important milestone that builds on strong working relationships from projects where CLG as a recognized world-class technology leader has partnered with BAPCO to improve its competitiveness while supporting development in Bahrain. CLG's past and current projects include BAPCO's existing hydrocracker and premium lubricant base oils plant, which employs CLG's ISODEWAXING and ISOFINISHING technologies.
